TITLE: A method for fastening a winding made of fine glass-covered wire to a current supply. Class 21, No. 171895 15

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 28

TOPIC TAGS: electric connector, glass coating, glass to metal seal 17

ABSTRACT: This Author's Certificate introduces a method for fastening a winding made of fine glass-covered wire to a current supply. The point of contact is then galvanized. The fastening process is simplified and the reliability of the contact point is improved by using cold welding to fasten the ends of the coil to the current supply. The contact section and the glass-covered wire adjacent to it are then chemically silvered and a non-porous heat resistant coating is applied (nickel-copper-nickel).

for Microaggregate Analysis.

Orig Pub: Uch zap. Kazakhsk. un-t, 1956, 21, 180-185

Abstract: Experiments were conducted in the laboratory of the
Kzyl-Orda Scientific Experimental Base of the Academy
of Sciences Kazak SSR. For microaggregate and mechanical
analysis soil specimens from marshes which were
drying up, meadow-marsh soil, and arable horizon soils
of rice fields were treated with distilled water, river
water, and aqueous extracts of the same soils. The

TITLE: Coating a metal with plastic film

SOURCE: Rechnoy transport, no. 10, 1964, 29-30

TOPIC TAGS: plastic coating, polyvinylbutyral, metal coating, fluidized bed

ABSTRACT: Plastic film coating (0.1-1 mm thick) of metal parts at the Moskovskiy sudostroitel'no - sudoremontnyy zavod (Moscow Ship-Building and Ship-Repair Plant), at the Kalininskiy i Leningradskiy vagonostroitel'nyye zavody* (Kalinin and Leningrad Railway-Car Factories), and at the Kiyevskiy zavod torgovogo mashinostroyeniya (Kiev Industrial Machinery Factory) is described. The metal parts are coated by heating and submerging them in a fluidized bath of thermoplastic particles (0.05-0.2 mm particle size, usually consisting of about 96-97.5% polyvinylbutyral, 0.9-2.8% titanium dioxide, and some coloring additives (experiments with polyethylene are also being performed). The bath used for coating the parts is shown in Fig. 1 on the Enclosure. Compressed air is introduced at (3), passes uniformly through a porous ceramic or other material (2), and enters the fluidized bath (1) which can have various shapes, depending on the parts to be

Card 1/3

0
coated. It was found that the metal parts should be cleaned thoroughly (with organic solvents or salt baths) and, for polyvinylbutyral coating, they have to be heated to 350-400C. It is hoped that plastic coatings will replace chrome-nickel coating of metal parts in many applications. Orig. art. has: 3 figures.

TITLE: Experience in unshielded arc welding with bare alloy wire

SOURCE: Avtomaticheskaya svarka, no. 10, 1965, 52-54

TOPIC TAGS: unshielded arc welding, welding technology, shipbuilding engineering, construction

ABSTRACT: Mechanized unshielded arc welding with bare alloy wire, developed in 1962 at the Ye. O. Paton Institute of Electric Welding, dispenses with the use of shielding atmospheres which is of major importance to mechanizing welding operations in shipbuilding and construction. What is more, it reduces by 35-40% the number of transverse deformations compared with manual and submerged-arc welding. The technique has been used with positive results to mechanize reinforcement-welding operations during the construction of poured-on-the-spot and precast reinforced concrete structures in the Konakovo, Kirishev and Burshtyn power stations, where it has served to markedly

UDC: 621 791.753.037

L 9534-66

ACC NR: AP5026293

6
reduce the cost and time of the construction and assembling operations. The related experience shows that use of this technique to weld 100 joints of 40 mm thick reinforcement in the vertical position saves about 450 rubles and in the bottom position, 165 rubles (compared with manual welding). Mechanized unshielded arc welding has also been introduced since 1963 at the Gomel and Astrakhan shipyards, with similarly satisfactory results. In addition, it has been used to weld together sheets of structural metal. It is a technique that assures an increase in productivity and reduction in production cost in conditions when other methods of mechanized welding are not applicable. TITLE: Solubility of acetylene in selective solvents at low temperatures

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 17, 1962, 476, abstract 17M192 (Novosti نفت. i gaz. tekhn. Neftepererabotka i neftekhimiya, no. 12, 1961, 33 - 39)

TEXT: The solubility of acetylene (I) in eight solvents (acetone, methanol, methyl pyrrolidon, dimethyl formamide, dimethyl acetate, ethyl ether, m-xylene, and dichloroethane), was determined in relation to the temperature, at $P_{C_2H_2} = 1$ atm. It is shown that the solubility of I in

these solvents increases abruptly as the temperature is reduced. An empirical equation for the solubility of acetylene in solvents with relation to the temperature is given. [Abstracter's note: Complete translation.] ✓

TITLE: Solubility of acetylene in methanol at high pressure

SOURCE: Neftepererabotka i neftekhimiya, no. 5, 1965, 37-40

TOPIC TAGS: acetylene, solubility, methanol, solvent action, solvent extraction, solvent

ABSTRACT: The last stage of the high pressure extraction of acetylene from natural gas mixtures was studied. It consisted of the acetylene absorption by selective solvents (methyl alcohol). Its solubility in methanol was determined within the temperature range from 20C to that of condensation and under pressures up to 19 absolute atmospheres by the procedure described by I. P. Usyukin, V. M. Shleynikov, A. V. Timofeyev, G. N. Shchekina ("Neftepererabotka i neftekhimiya," No. 11, TsNIITneftegaz, 1963, p. 35). Acetylene solubility in methanol increased with temperature decrease, while at a constant temperature it increased with the rise in pressure. The comparison of the results obtained with the data previously published is shown graphically in Fig. 1 on the Enclosure. The data from different sources correlated satisfactorily. The representation of the results in the coordinates:
Cord 1/5

L 53664-65

ACCESSION NR: AP5013516

solubility logarithm - reverse temperature was used to derive an empirical equation for the calculation of acetylene solubility in methanol $\lg \alpha = \frac{A}{T} - B$. Here α - solubility, nm^3/m^3 ; T - temperature, $^{\circ}\text{K}$; A, B - empirical constants depending on pressure. The values of A and B are tabulated below.

Pressure atm	A	B
0.5	950	2.48
1.0	975	2.27
3	1000	1.93
5	1020	1.80
7	1060	1.80
9	1100	1.80
11	1120	1.76
13	1200	1.96
15	1250	2.07
17	1350	2.35
19	1420	2.51

The equation held true for the whole temperature range of the experiment under pressures up to 9 absolute atmospheres. At pressures exceeding this value it was true for temperatures up to -100°C . Orig. art. has: 3 tables, 3 figures, and 3 formulas.

TITLE: Phase equilibria in the system N-methylpyrrolidinone-carbon dioxide at high pressures

SOURCE: Neftepererabotka i neftekhimiya, no. 12, 1966, 36-39

TOPIC TAGS: carbon dioxide, methylpyrrolidinone, carbon dioxide solubility, heat of solution

ABSTRACT:

A study has been made of the solubility of carbon dioxide in N-methylpyrrolidinone (NMP) in the -20 — $+20^{\circ}\text{C}$ range under pressures of up to 20 atm. The study was undertaken to establish the optimum conditions for the absorption of CO_2 from gas mixtures at high pressures and low temperatures. The experimental procedure was described by the authors in an earlier study (Neftepererabotka i neftekhimiya, 1963, no. 1, p. 39). The results of the experiments given in the table indicate that the solubility of CO_2 increases with decreasing temperatures, and that the sharpest increase is observed at pressures above 6 atm. Analysis of the

Card 1/3

UDC: 547.745-185

ACC NR: AP7002726

can be expressed by the formula of Krichevskiy-Il'inskaya. An empirical formula was derived for determining the solubility of CO_2 in NMP in the studied temperature and pressure range. The heat of solution of CO_2 in NMP was found to be 3540 cal/mol. Orig. art. has: 6 figures and 3 tables.

TITLE: Correlation method for recognition¹⁶⁰ of sequences of pictures

SOURCE: AN UkrSSR. Chitayushchiye avtomaty i raspoznavaniye obrazov (Reading devices and pattern recognition). Kiev, Naukova dumka, 1965, 62-69

TOPIC TAGS: pattern recognition, correlation statistics

ABSTRACT: The problem of pattern recognition is treated in terms of information transmission over a noisy channel. Ideal pictures S_1, S_2, \dots, S_k are sent; they undergo random distortions in the channel. Thus, a set of received pictures V corresponds to a single true picture S_1 that was dispatched at the sending end of the channel. The above terms are also suitable for formulating the following problem: A number of ideal pictures S_1, S_2, \dots, S_k are subdivided into m -long sequences, the number of the sequences being smaller than k . Individual elements of a sequence are applied to separate channels. Judging by the received pictures, it is required to

Card 1/2

L 28061-66

ACC NR: AT6005569

0

find the most probable sequence at the channel input. The above problem is solved for the specific case when S_1, S_2, \dots, S_k are represented by the literals of a typed text; the pictures S_i are regarded as N -dimensional vectors, and the sequences are treated as $m \times N$ -dimensional vectors. A conditional distribution of pictures at the channel output, when a sequence P is applied to its input, is denoted by $p(V/P)$.

Then, the final formula is: $f(V, P) = \sum_{i=1}^m (V^{(i)} \cdot S^{*(i)})^2$. This formula shows how to find the measure of similarity between the picture sequences and the standard sequences: to this end, the correlations between individual pictures and standards should be evaluated, and their squares summed up. Orig. art. has: 21 formulas.

AUTHORS: Petrenko, A.I. and Shlezinger, M.I.
TITLE: Functional converter with digital output
PERIODICAL: Izvestiya vysshikh uchebnykh zavedaniy, Radiotekhnika,
v. 6, no. 1, 1963, 96 - 97
TEXT: In an earlier paper (Izv. vuzov SSSR - Radiotekhnika,
1961, 4, no. 6, 711) the author described a functional converter
which could read graphical functions recorded on tape or film.
This converter had an analog output which could be connected to a
digital voltmeter. It is possible, however, to obtain a digital
code for the signal by introducing a digital comparison system
into the servo system of the converter. The comparison system
would consist of coincidence circuits with a controlled reversible
counter. The remaining elements such as the time-base generator,
photo-optical device, time-base radiating device and adding
amplifier would be the same as in the earlier converter. The
pulse of the photo-electron amplifier, produced at the instant of
the ray crossing the graph, operates a trigger circuit (in the
same manner as in the earlier converter) which is reset by a
Card 1/2

Functional converter

S/142/63/006/001/015/015
E192/E382

synchronizing pulse related to the commencement of the time-base cycle. In the earlier converter the pulses from the trigger were applied to a single integrator whose output was connected to the plates of the oscilloscope. Here, two integrators are employed which are driven by the pulses from the anodes of the trigger circuit. A univibrator producing a rectangular pulse whose duration is equal to that of the time-base period is also triggered by the synchronizing pulses. If a positive signal appears at the output of one of the integrators, this actuates a coincidence circuit. The situation is similar as regards the second integrator. The pulses from the outputs of the coincidence circuits are applied to a reversible binary counter where they are counted either in the positive or negative sense, depending on their origin. The output of the counter is converted into a corresponding potential which is fed to the deflection plates via the adding amplifier. There is 1 figure.

TITLE: Experiments of modeling the "Al'fa" system with positive feedback on a computer

PERIODICAL: Avtomatyka, no. 2, 1963, 82-88.

TEXT: The Institute of Electrical Engineering of the Academy of Sciences of the Ukrainskaya SSR developed a structural circuit of system "Al'fa" which showed an amazing property of spontaneous organization under certain conditions. The operation of this system was modeled on the "vvvv" computer. This article describes the structural diagram of "Al'fa" with sixth positive feedback, its properties and modeling of operation. The principal problem lay in studying the learning processes as a function of certain parameters and finally in the principal capability of spontaneous recognition of images. The principal English language reference is F. Rosenblatt's, "Principles of Neurodynamics", Spartan Book, New York, 1962. The difference between the American system, "Perceptron" and "Al'fa" is the fact that the latter has specific transducers of signs and determined and rather than random connections between elements. The article contains 6 figures, 4 tables and a 4 item bibliography. The author expresses his gratitude to associates of the Instytut kibernetiky AN URSSR

SOURCE: AN UkrSSR. Chitayushchiye avtomaty i raspoznavaniye obrazov (Reading devices and pattern recognition). Kiev, Naukova dumka, 1965, 38-45

TOPIC TAGS: pattern recognition, perceptron

ABSTRACT: An attempt is made to introduce a quantitative measure of the quality of information into the problem of spontaneous pattern recognition. A probability density function $p(x)$ is specified within a set X . The set X is to be subdivided into a specified number of nonintersecting classes X_1, X_2, \dots, X_n in such a way that the

formula: $R = \sum_k P(k) \iint_{X_k \times X_k} S(x, y) p(x/k) p(y/k) d\lambda(x) d\lambda(y)$ be minimized; here, $P(k)$ is the probability of k -th class, $p(x/k)$ is the conditional probability density in the k -th class. This particular case of the above problem is set forth in the article: the set X

TITLE:

The Properties of Copolymers of Ethylene and Propylene

PERIODICAL:

Kauchuk i rezina, 1960, No. 11, pp. 1-5

TEXT:

The authors list data on the properties of $CH_3\pi$ (SKEP), one of the ethylene and propylene copolymers synthesized at the VNIISK. It is pointed out that research in the field of polymerization of ethylene hydrocarbons at the VNIISK was begun in 1956. It is stated that the indicated copolymers can be produced within a wide range of molecular weights. The hardness of the polymers, according to Defoe, is 1,400-5,000 g, characteristic elasticity of their solution is from 2.5 (and lower) to 9.0. The vitrification point of the SKEP copolymer is within the range of -50 to 70°C depending on the ratio of the ethylene and propylene. The SKEP copolymers are a dense white hard mass, comparatively easy to process on the rollers. Destruction occurs when they are processed mechanically on the rollers. The greatest destruction is observed in polymers with a high

Card 1/5

The Properties of Copolymers of Ethylene and Propylene

molecular weight (Table 1). Mixtures based on SKEF copolymer were prepared on laboratory rollers at a temperature of 50-60°C. It was found that SKEF copolymers are easily mixed with comparatively large quantities of fillers. Mixtures without softeners are dry, brittle, their surface resembling shagreen leather. During vulcanization they easily form a monolithic mass with a smooth, shiny surface. Vulcanization is carried out at 150-160°C. SKEF copolymer-based mixtures are characterized by a large vulcanization plateau (Fig. 1). The vulcanizates of non-filled mixtures based on the ethylene and propylene copolymer have a low tear-resistance. When a filler is added, especially gaseous channel carbon black and active furnace carbon black of the XA ϕ (KhAF) type, the tear-resistance increases significantly. Vulcanizates containing one of the indicated carbon blacks in a quantity of 50 weight parts hardly differ in this index from similar vulcanizates based on natural rubber (Fig. 2). The physico-mechanical properties of carbon black vulcanizates based on SKEF copolymers depend on the molecular weight of the latter. A detailed study of the physico-mechanical properties of the SKEF copolymers was conducted for a mixture containing 45 weight parts of KhAF carbon black. Comparisons were made

Card 2/5

The Properties of Copolymers of Ethylene and Propylene

between these properties and those of the C-23 (S-23) rubber, CKE-30A (SKS-30A) and natural rubber. Gaseous channel carbon black was used as the filler for natural and SKS-30A rubber, which causes optimum stability properties in the indicated rubbers. Vulcanizates of carbon black mixtures based on SKEP copolymer were found to be almost equal to the vulcanizates of similar mixtures based on natural rubber and SKS-30A in their tear-resistance and relative expansion. Higher moduli are obtained at 300% expansion in SKEP vulcanizates by the application of a high standard carbon black (KhAF) instead of channel carbon black. The values of the vulcanizate moduli of the SKEP mixtures may be increased or decreased by using various methods of vulcanization. The SKEP vulcanizate mixtures have lower residual elongations than the natural rubber and SKS-30A vulcanizates. They also have a higher elasticity to recoiling at ordinary and high temperatures, which is explained by the comparatively low content of side groups in the polymer chains. When elevating the testing temperature to 100°C, the tear-resistance dropped in the SKEP vulcanizates to a greater degree than in the natural rubber vulcanizates, although it remained sufficiently

Card 3/5

89595
S/138/60/00/011/001/010
1061.4120

The Properties of Copolymers of Ethylene and Propylene

high. In this index the experimental SKEP copolymers greatly surpass SKS-3-A rubber. Due to the almost complete absence of double bonds in the SKEP copolymer, rubbers based on the latter have a very high aging resistance at 100°C and at 150°C and are better in this respect than natural rubber. SKEP polymers are characterized by low hysteretic losses. In this respect they are almost equal to natural rubber and surpass SKS-30A rubbers significantly. Other valuable properties of the SKEP vulcanizates were found to be their high resistance to crack expansion in repeated bending deformations and a high wear-resistance. The latter surpass the natural rubbers greatly in their tear-resistance and come close to the regularly constructed divinyl rubbers (Ref. 5). Since different types of carbon blacks were used as fillers for SKEP, natural and SKS-30A rubbers, it was assumed that the high wear-resistance of the SKEP vulcanizates was connected with the use of the KhAF carbon black, which renders a higher wear-resistance. Additional experimental testing revealed that the type of carbon black has little effect on the wear-resistance of the vulcanizates of carbon black mixtures in the case of vulcanizates based on natural and SKS-30A rubber

TITLE: Preparation of ethylene-propylene rubber. Class 39, No. 181285

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 9, 1966, 74

TOPIC TAGS: rubber, ethylene propylene rubber, copolymerization

ABSTRACT: This Author Certificate introduces a method of preparing ethylene-propylene rubber by copolymerization of ethylene with propylene in an organic solvent at a temperature below 30C in the presence of a complex catalyst consisting of organometallic compounds of the I-III groups and salts of metals of variable valence of the IV-VIII groups. To extend the variety of organic solvents, chlorinated aliphatic hydrocarbons such as carbon tetrachloride, methylene chloride, dechloroethane, or ethyl chloride are suggested. [Translation] [LD]
